

The fluctuations in the percentages showing the distribution of the population at the censuses of 1880 and 1890 according to quinquennial ages, especially for the earlier periods of life, are probably due to several causes. One of the most potent reasons for the decline in the proportion of children among native white persons of native extraction is found in the disinclination of native born mothers of the present generation to rear large families. If the data were available, it would probably be found that, relatively considered, the number of children born to native born women of native extraction was considerably less than the number born to any other class of mothers, although it would probably also be found that the proportion of children living at the time the census was taken to the whole number of children of native born women of native extraction was greater. In Massachusetts, where information of this character has been compiled, it was shown by the state census of 1885 that, although a much larger number of native born mothers had had a considerably less number of children than foreign born mothers, a much larger percentage of the whole number of children of native born mothers were living at the time of the state census than of the children of foreign born mothers, the exact percentage of living children of native born mothers being 71.50 and of foreign born mothers 66.34. Of the children of mothers of purely native parentage 71.14 per cent were living, and of those of mothers of purely foreign parentage 67.15 per cent were living. By the same census it was shown that of the whole number of native born women who were or had been married 20.18 per cent had had no children as against only 13.27 per cent of foreign born women who were or had been married. (a) Another important consideration is found in the great disproportion of the sexes in different parts of the country, females being largely in excess in the older and more easterly states and males in the newer and more westerly states and territories. This is due to the migration westward in large numbers of the native white male element and to the advent since 1820 of more than 15,000,000 of foreigners, principally adults and largely comprised of males, and of whom considerably more than one-half have come since 1870. The influence of this great body of foreign born is seen in the large proportion of native white persons of foreign parentage found in the earlier periods of life, that is, the children of immigrants who have been born in this country, and in the very small proportion of foreign white persons under 15 years of age. In 1890 somewhat more than one-half of all the native whites of foreign parentage were under 20 years of age and very nearly nine-tenths under 35 years of age; of all the foreign whites in 1890 less than one-tenth were under 15 years of age. There has been, also, an apparent diminution in the number of marriages, proportionally, among native white women of native extraction, but this decline can not be determined with any degree of accuracy, owing to the abnormal conditions just alluded to concerning white persons of foreign birth or extraction. The statistics of conjugal condition in 1890 showed that of all the native white females of native parentage who were 15 years of age and upward, 69.30 per cent were or had been married as compared with 49.00 per cent for native white females of foreign parentage and 79.24 per cent for foreign white females of the same age, but just what part of these differences can be ascribed to the failure of native born women of native extraction to assume the marriage relation can not be definitely stated. If a comparison is made with females of negro descent who were 15 years of age and upward in 1890, it is found that the percentage of those who were or had been married among this class was only slightly larger, or 69.79 per cent. The greater mortality of the negro race as compared with the whites also has an important bearing upon the question of age distribution. Besides these reasons, the losses and disturbed conditions arising from the civil war should be borne in mind, as well as the fact that to the varying degree of care and accuracy with which each enumeration is made some of the changes noted may be due.

^a Census of Massachusetts, 1885; Population and Social Statistics, Part II, pages cv, cix, and cxiv.

The entire male population of the United States in 1890 exceeded the entire female population by 1,513,510, subdivided by general nativity and color, as follows:

GENERAL NATIVITY AND COLOR.	Total.	Males.	Females.	Excess of males.

b Females in excess.

As shown by the above table, it appears for the aggregate population that, with the exception of the period from 15 to 19 years, the males exceed the females at each quinquennial age up to 80 years. From that point the females were slightly in excess. Among those for whom the age was unknown the males were largely in excess. The same conditions as just noted were apparent for each element of the population, but, in addition, the females were in excess for the periods from 20 to 24 years and 25 to 29 years among the native whites of foreign parentage, and for the periods from 20 to 24 years and 40 to 44 years among the colored.

The distribution by age periods of the excess of males (or females) for each element of the population, for each of the five geographical divisions, is shown in the following table:

The figures contained in the preceding table illustrate the varying conditions with respect to age and sex which govern the population in the different sections of the country, and show very clearly the influence of native and foreign immigration upon its composition. This becomes more apparent when the excess of males (or females) in each geographical division is distributed according to conjugal condition, as shown by the following table:

GEOGRAPHICAL DIVISIONS.	Total.	Single.	Married.	Widowed.	Divorced.	Unknown.

a Females in excess.

In the whole country there was an excess in 1890 of 2,761,588 single males, 70,032 married males, and 34,862 males for whom the conjugal condition was unknown, this excess of males being partially offset by an excess of 1,339,178 widowed females and 22,794 divorced females, leaving a net excess of 1,513,510 males, as before stated. The excess of single males is common to each geographical division, but among the married the males were in excess in the North Atlantic, North Central, and Western divisions, and females in the South Atlantic and South Central divisions. Widowed females were uniformly in excess in each geographical division, and this was largely the case with divorced females, except in the Western division, where divorced males were slightly in excess. Among those for whom the conjugal condition was unknown, the males were in excess in all but the South Atlantic division.

The distribution of the excess of males (or females) according to conjugal condition is shown for the United States, by general nativity and color, as follows:

b Persons of negro descent, Chinese, Japanese, and civilized Indians.

Single males were in excess in 1890 for each element of the population, married males for the foreign white and colored, and married females for the native whites of both native and foreign parentage. Widowed females were in excess in each case, and divorced females with the exception of the foreign white. Among those for whom the conjugal condition was unknown males were in excess in all cases.

The following table shows, for the whole country, the excess of males (or females) according to conjugal condition, distributed by age periods:

a Females in excess.

The excess of single males in 1890 was apparent at each age period, and was largest from 20 to 24 years and next largest from 25 to 29 years, more than one-half of the whole excess of single males being found in these two age periods. Married females were in excess at each age period to 30 years, but for each age period thereafter married males were in excess. The excess of widowed females was common to each age period, and of divorced females to 55 years; from that point divorced males were in excess. Males for whom the conjugal condition was unknown were in excess at each age period except from 15 to 19 years.

The population of cities of 25,000 inhabitants or more in 1890 has been distributed by age periods, and the results for each city given in detail in the general tables. These cities, 124 in number, contained in the aggregate 13,989,568 inhabitants, or a little more than one-fifth of the entire population of the country. Of the whole number of persons in these cities 4,565,730 were native white persons of native parentage, constituting a little more than one-eighth of all the native whites of native parentage; 4,543,044 were native white persons of foreign parentage, constituting very nearly two-fifths of all the native whites of foreign parentage; 4,029,709 were foreign white persons, constituting not quite one-half of all the foreign white, and 851,085 were colored persons, constituting about one-ninth of all the colored.

The following table shows the population of these 124 cities, taken collectively, subdivided by general nativity and color and distributed by age periods, as compared with similar results for the remainder of the country:

The influence of immigration upon the composition of the population is shown very graphically by the following table, which gives the percentage which each element of the population in 1890 constituted of the whole number of persons of each quinquennial age:

a Persons of negro descent, Chinese, Japanese, and civilized Indians.

Among the population at large, without regard to age, native white persons constituted 73.23 per cent, foreign white persons 14.57 per cent, and colored persons 12.20 per cent. This distribution was approximately maintained for one age period only, from 20 to 24 years. For each of the age periods prior thereto there was a much larger percentage of native white and colored, and a relatively smaller percentage of foreign white. For each age period beyond 24 years the percentage of foreign white was much larger than the average, without respect to age, and those for the native white and colored correspondingly less. The tendency of the colored to exaggerate their age, especially for those who have gone beyond the allotted time of life, is seen in the increased percentages reported for the age periods from 80 years and upward. This is especially the case for those from 90 to 94 years of age, of whom 20.63 per cent were colored; for those from 95 to 99 years, of whom 34.81 per cent were colored; and for those 100 years and over, of whom 73.52 per cent were colored. Persons 100 years of age and over in 1890 numbered 3,981, of whom 2,927 were colored. More than three-fourths of the persons reported as 100 years of age and over, or 3,092 in all, were found in the southern states, and of this number very nearly nine-tenths were colored. There were about the same number of persons reported in the census of 1880 as being 100 years of age and over, or 4,016, of whom four-fifths were found in the southern states, and of those in the south more than seven-eighths were colored.

Of the 5,648 persons from 95 to 99 years of age in 1890, 1,966, or a little more than one-third, were colored; and of those from 90 to 94 years of age, or 23,645 in all, 4,879, or a little more than one-fifth, were colored.

SCHOOL ATTENDANCE.

The whole number of persons attending school during any portion of the census year ending May 31, 1890, was 11,674,878, of whom 5,954,142 were males and 5,720,736 were females. White persons numbered 10,667,171, and constituted 91.37 per cent of the total number attending school, and colored persons 1,007,707, or 8.63 per cent. There were 10,153,289 native white persons attending school, constituting 86.97 per cent of the whole number, and 513,882 foreign white persons, constituting 4.40 per cent of the whole number. Native white persons comprised 7,204,755 of native parentage and 2,948,534 of foreign parentage, constituting 61.71 and 25.26 per cent, respectively, of the entire number of persons attending school.

The distribution by sex according to general nativity and color does not present marked differences, as shown by the following table:

Of the whole number of persons attending school, 8,330, or 0.07 per cent, were under 5 years of age; 3,726,044, or 31.92 per cent, were from 5 to 9 years; 5,607,358, or 48.03 per cent, were from 10 to 14 years; 2,155,141, or 18.46 per cent, were from 15 to 19 years; and 178,005, or 1.52 per cent, were 20 years of age and over. These figures, together with a similar distribution for males and females, are given in the following table:

From this table it is seen that by far the largest proportion of foreign white persons attending school were from 10 to 14 years of age, and that this was also the case with the colored as a class, including persons of negro descent. There was a larger percentage of persons of this age among native white persons, both of native and foreign parentage, than for any other age period, but the percentage was not nearly as large as for the foreign white. The largest percentage of persons from 5 to 9 years of age was that for native white persons of foreign parentage, and the smallest percentage of those from 15 to 19 years of age was that for foreign white persons.

The following table shows the distribution by age periods and by general nativity and color for males and females, respectively:

In connection with the age distribution of persons attending school, it is interesting to know the proportion which they bore to the whole number of persons of each specified age. Omitting the small number of persons attending school under 5 years of age and 20 years of age and over, the following table shows, in the aggregate and by general nativity and color, the whole number of persons from 5 to 9 years, 10 to 14 years, and 15 to 19 years, respectively, the number attending school at each age, and the percentage of persons attending school of the whole number of persons:

α Persons of negro descent, Chinese, Japanese, and civilized Indians.

Of the native whites of native parentage about one-half of those from 5 to 9 years of age, considerably more than four-fifths of those from 10 to 14 years of age and a little more than two-fifths of those from 15 to 19 years of age attended school during the census year. Among the native whites of foreign parentage there was a considerably larger percentage attending school from 5 to 9 and from 10 to 14 years of age and a much less percentage from 15 to 19 years of age than for the native whites of native parentage, or about three-fifths, very nearly nine-tenths, and a little more than one-fourth, respectively. Among the foreign white there was about the same percentage from 5 to 9 years as for the native whites of foreign parentage, but a much less percentage for each of the other two age periods, or only three-fourths of those from 10 to 14 years of age, and a little more than one-tenth of those from 15 to 19 years of age. Among the colored not quite one-fourth of those from 5 to 9 years of age attended school, a little more than one-half of those from 10 to 14 years of age, and about one-fifth of those from 15 to 19 years of age.

The distribution of persons attending school according to months of school attendance is given in the following table:

MONTHS OF SCHOOL ATTENDANCE.	BOTH SEXES.		MALES.		FEMALES.	
	Number.	Per cent.	Number.	Per cent.	Number.	Per cent.
Aggregate	11,674,878	100.00	5,954,142	100.00	5,720,730	100.00

6 months or more	7,240,177	62.07	3,587,270	60.25	3,058,808	53.00

Persons attending school 1 month or less during the census year constituted a little more than 5 per cent of the whole number, those attending from 2 to 3 months not quite 15 per cent, those attending from 4 to 5 months a little over 17 per cent, and those attending 6 months or more about 62 per cent. There were between 1 and 2 per cent more males than females attending school from 2 to 3 months, about 2 per cent more from 4 to 5 months, and very nearly 4 per cent less males attending school 6 months or more.

A detailed statement by general nativity and color for persons attending school, distributed according to months of school attendance, follows:

One of the most significant results shown by the above table is the relatively small percentage of native white persons of native parentage who attended school 6 months or more during the census year, as compared with the percentage of native white persons of foreign parentage and of foreign white persons. Of all the native white persons of native parentage, less than three-fifths attended school 6 months or more, as compared with more than three-fourths for the other two classes mentioned. This is readily accounted for when it is remembered that very nearly two-fifths of all the native whites of foreign parentage and not quite one-half of all the foreign whites were found in cities of 25,000 inhabitants or more in 1890, as against a little more than one-eighth of all the native whites of native parentage. In other words, a very much larger proportion of the first two classes named were living in closely settled districts, where schools were numerous and easily accessible, and where the law or custom insures attendance at school for a much longer period than is possible in the rural districts, where the purely native element of our population is more numerous. Aside from those attending school 1 month or less, there is a very even distribution of colored for the other three periods of school attendance.

Relatively the same conditions as just noted are apparent for males and females, when considered separately, as shown by the following table:

Considering the distribution of persons attending school according to months of school attendance in connection with age, the following table is obtained:

MONTHS OF SCHOOL ATTENDANCE.	UNDER 10 YEARS.		10 TO 14 YEARS.		15 YEARS AND OVER.	
	Number.	Percent.	Number.	Percent.	Number.	Percent.

Analyzing the results for males and females, it is seen that there is a much larger percentage of females 15 years of age and over who attended school 6 months or more than of males of the same age. It will also be noticed that the percentage of females 15 years of age and over who attended school 6 months or more is not so widely different from those reported for females under 10 years and from 10 to 14 years of age who attended school for the same period of months, but that for the males the difference is very much more marked. Of all the females 15 years of age and over who attended school during the census year, 59.81 per cent attended 6 months or more as compared with 62.33 per cent for females under 10 years of age and 66.68 per cent for females from 10 to 14 years of age. These percentages are contrasted with similar percentages for males, being 47.85 per cent for males 15 years of age and over, 63.80 per cent for males 10 to 14 years of age, and 63.00 per cent for males under 10 years of age.
